Chapter 4: Designing Studies

Key Vocabulary:

- sample
- population
- sample survey
- voluntary response sample
- confounded
- design
- convenience sampling
- biased
- simple random sample
- table of random digits
- probability sample
- stratified random sample
- cluster sampling
- inference
- margin of error

- strata
- undercoverage
- nonresponse
- response bias
- sampling frame
- systematic random sample
- observational study
- experimental
- confounding
- **lurking** extraneous variable
- experimental units
- subjects
- random assignment
- treatment
- factor

- level
- placebo effect
- single blind experiment
- control group
- completely randomized experiment
- randomized block desian
- matched pair design
- statistically significant
- replication
- hidden bias
- double-blind experiment
- block design
- data ethics

4.1 Sampling and Surveys (pp.206-224)

1. Explain the difference between a <i>population</i> and a <i>sample</i> .		
2.	What is involved in planning a <i>sample survey</i> ?	
3.	Why might convenience sampling be unreliable?	
4.	What is a <i>biased</i> study?	
5.	Why are voluntary response samples unreliable?	
6.	Define simple random sample (SRS).	
7.	What two properties of a <i>table of random digits</i> make it a good choice for creating a simple random sample?	
8.	State the two steps in <i>choosing an SRS</i> :	
9.	What is the difference between sampling with replacement and sampling without replacement?	
10.	How can you account for this difference with and without replacement when using a table of random digits or other random number generator?	
11.	How do you select a <i>stratified random sample</i> ?	

12. What is <i>cluster sampling</i> ?
13. What is inference?
14. What is a margin of error?
15. What is the benefit of a <i>larger</i> sample size?
16. A sampling frame is
17. Give an example of <i>undercoverage</i> in a sample.
18. Give an example of <i>nonresponse bias</i> in a sample.
19. Give an example of <i>response bias</i> in a sample.
20. How can the wording of questions cause <i>bias</i> in a sample?
21. Answer the two questions for the <i>Check Your Understanding</i> on page 224.

4.2 Experiments (pp.231-251)

1.	Explain the differences between <i>observational study</i> and <i>experiment</i> .
2.	A lurking variable is
3.	What problems can lurking variables cause?
4.	Confounding occurs when
5.	Answer the four questions for the <i>Check Your Understanding</i> on page 233.
6.	Explain the difference between experimental units and subjects.
7.	Define treatment.
8.	By studying the TV Advertising example on page 235, identify the <i>factors</i> and <i>levels</i> in the experiment.
9.	Explain why the example, Which Works Better: Online or In-Class SAT Preparation, is a bad experiment.
10.	What is random assignment?
11.	What is a <i>comparative</i> experimental design?
12.	In a completely randomized design

13. Does using chance to assign treatments in an experiment guarantee a completely randomized design? Explain.	
14. What is the significance of using a <i>control group</i> ?	
15. The basic <i>principles of statistical design</i> experiments are:	
16. Define <i>control</i> , <i>random assignment</i> and <i>replication</i> in experimental design.	
17. Describe the <i>placebo effect</i> .	
18. What are the differences between a <i>double-blind</i> and <i>single-blind</i> experiement?	
19. Define statistically significant.	
20. What is a <i>block</i> ?	
21. What is a randomized block design?	
22. When does <i>randomization</i> take place in a block design, and how does this differ to completely randomized design?	a
23. What is the goal of a matched pairs design?	
24. When is it beneficial to use a blocked/paired design? How should we choose which variables to block for?	

4.3 Using Studies Wisely (pp.261-267)

- 1. Name the two *types of inferences* that can be identified based on the design of a study.
- 2. Name the *challenges* of establishing causation.
- 3. What are the four criteria for establishing causation when we can't do an experiment?
- 4. Briefly describe the basics of *data ethics*.
