## Chapter 6 AP Statistics PRACTICE Test

Section I: Multiple Choice Select the best answer for each question.

Questions T6.1 and T6.2 refer to the following setting. A psychologist studied the number of puzzles that subjects were able to solve in a five-minute period while listening to soothing music. Let X be the number of puzzles completed successfully by a subject. The psychologist found that X. had the following probability distribution:

| Value of X:  | 1   | 2   | 3   | 4   |
|--------------|-----|-----|-----|-----|
| Probability: | 0.2 | 0.4 | 0.3 | 0:1 |
| Tipi         | 12  | 8   | .9  | 14  |

T6.1.\What is the probability that a randomly chosen subject completes at least 3 puzzles in the five-minute period while listening to soothing music?

- (a) 0.3
- (b) 0.4
- (c) 0.6

- (d) 0.9
- (e) Cannot be determined

T6.2.\ Suppose that three randomly selected subjects solve puzzles for five minutes each. The expected value of the total number of puzzles solved by the three subjects is

- (b) 2.3.
- (c) 2.5. ((d) 6.9.)

$$E(x) = \sum_{x \in P_1} = .2 + .8 + .9 + .4 = 2.3$$
  
 $E(3 \text{ Subjects}) = 2.3 + 2.3 + 2.3 = 6.9$ 

TT6.3.\ Suppose a student is randomly selected from your school. Which of the following pairs of random variables are most likely independent?

- (a) X = student's height; Y = student's weight
- (b)  $X = \text{student's } IQ; Y = \text{student's } GPA^{NOT}$
- (c) X = student's PSAT Math score; Y = student's PSATVerbal score MOTIND
- (d) X = average amount of homework the student does per night; Y = student's GPA NOT 140
- (e) X = average amount of homework the student does per night; Y = student's height | NOEPENDENT - ON E

DOES NOT INFLUENCE THE OTHER

T6.4.\A certain vending machine offers 20-ounce bottles of soda for \$1.50. The number of bottles X bought from the machine on any day is a random variable with mean 50 and standard deviation 15. Let the random variable Y equal the total revenue from this machine on a given day. Assume that the machine works properly and that no sodas are stolen from the machine. What are the mean and standard deviation of Y?

(a) 
$$\mu_Y = $1.50$$
,  $\sigma_Y = $22.50$ 

(b) 
$$\mu_Y = $1.50, \sigma_Y = $33.75$$

(c) 
$$\mu_Y = $75$$
,  $\sigma_Y = $18.37$ 

(d) 
$$\mu_{\rm Y} = $75$$
,  $\sigma_{\rm Y} = $22.50$ 

(e) 
$$\mu_Y = $75$$
,  $\sigma_Y = $33.75$ 

$$Ly = 50 * 1.5 = $75$$

$$6y = 15 * 1.5 = $22.50$$

Questions T6.5 and T6.6 refer to the following setting. The weight of tomatoes chosen at random from a bin at the farmer's market is a random variable with mean  $\mu=10$ ounces and standard deviation  $\sigma=1$  ounce. Suppose we pick four tomatoes at random from the bin and find their total weight T.

T6.5. The random variable T has a mean of

(a) 2.5 ounces.

(d) 40 ounces.

(b) 4 ounces.

(e) 41 ounces.

(c) 10 ounces.

T6.6. The random variable T has a standard deviati ounces) of

(a) 0.25.

(b) 0.50.

(c) 0.71. (d) 2.

$$\sqrt{1^2 + 1^2 + 1^2 + 1^2} = \sqrt{4}$$

n=.001224

T6.9.1 The figure shows the probability distribution of a discrete random variable-X. Which of the following best describes this random variable?

T6.7. Which of the following random variables is geometric?

(a) The number of times I have to roll a die to get two 6s.

(b) The number of cards I deal from a well-shuffled deck of 52 cards until I get a heart.

(c) The number of digits I read in a randomly selected row of the random digits table until I find a 7. LOOKING FOR THE IST

(d) The number of 7s in a row of 40 random digits. Occurred 4 7

(e) The number of 6s I get if I roll a die 10 times.

T6.8. Seventeen people have been exposed to a particular disease. Each one independently has a 40% chance of contracting the disease. A hospital has the capacity to handle 10 cases of the disease. What is the probability that the hospital's capacity will be exceeded?

(a) 0.011 (b) 0.035 (c) 0.092 (d) 0.965 (e) 0.989

(a) Binomial with n = 8, p = 0.1

max<H

P1:L1,L2

(b) Binomial with n = 8, p = 0.3

(c) Binomial with n = 8, p = 0.8

(d) Geometric with p = 0.1

(e) Geometric with p = 0.2

Geometricis typically stewed

$$P(X>10) = 1 - P(X \le 10)$$
  
 $1 - .965 = .0348$   
binomclf(17, .4, 10) = .965

T6.10. A test for extrasensory perception (ESP) involves asking a person to tell which of 5 shapes—a circle, star, triangle, diamond, or heart—appears on a hidden computer screen. On each trial, the computer is equally likely to select any of the 5 shapes. Suppose researchers are testing a person who does not have ESP and so is just guessing on each trial. What is the probability that the person guesses the first 4 shapes incorrectly but gets the fifth correct?

(d) 
$$\binom{5}{1} \cdot \left(\frac{4}{5}\right)^4 \cdot \left(\frac{1}{5}\right)$$

(b) 
$$\left(\frac{4}{5}\right)^4$$

(c) 
$$\left(\frac{4}{5}\right)^4 - \left(\frac{1}{5}\right)$$

P(S) = 
$$\frac{1}{5}$$
  
the P(F) =  $\frac{4}{5}$   
P(FFFS)
