Sampling Distribution for Difference of 2 Proportions

HW EXAMPLE #1: To explore the sampling distribution of the difference between two proportions, let's start with two populations having a known proportion of successes.

✓ At School 1, 70% of students did their homework last night P₁=.7

n, = 100

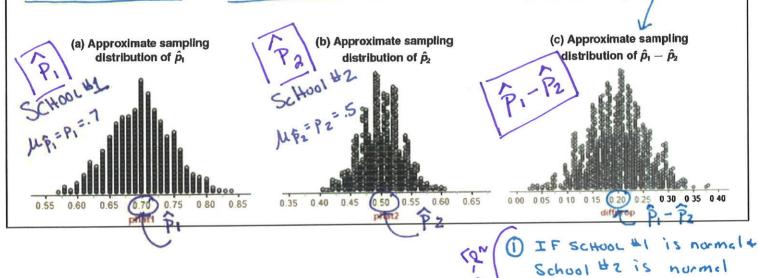

✓ At School 2, 50% of students did their homework last night. P₂=.5

12 = ZOO

Suppose the counselor at School 1 takes an SRS of 100 students and records the sample proportion that did their homework.

School 2's counselor takes an SRS of 200 students and records the sample proportion that did their homework.

Here are graphs of sampling distribution(each repeated 1000 times) for $\widehat{p1}$ and $\widehat{p2}$. What do you notice about the sampling distribution for for $\widehat{p1}$ - $\widehat{p2}$?

- School &z is normal 12 Sampling Distribution

CREDIT

$$n_1 p_1 = 100(.7) = 70 > 10$$

 $n_1 p_1 = 100(.3) = 30 > 10$
 $n_2 p_2 = 200(.5) = 100 > 10$
 $n_2 p_2 = 200(.5) = 100 > 10$

· MUST SHOW ALL 4 CALCULATIONS
· MUST SAY: THE SAMPLING
DISTRIBUTION P. - PZ IS
approximately normal because
all successes & failures
were at least 10.

Spread: Both schools meet the independence condition

School #1 = 100 (10) = 1,000 students / Both schools

school #2 = 200 (10) = 2,000 students / hel at least
2,000 students

$$6\hat{p}_1-\hat{p}_2=\sqrt{\frac{(.7)(.3)}{100}+\frac{(.5)(.5)}{200}}=.058$$

Mp. - Pz IN Repeated samples, the mean difference in Hw completion between Mp. - Pz the 2 schools would be about 20% in the long run Ep. - Pz on average, there would be about a 5.8% of flerence from the mean (20%) for the completion between the 2 schools.

Example #1 (continued): Who Does More Homework?

After the meeting, the 2 school counselor report to their principals that $\hat{p}_1 - \hat{p}_2 = 0.10$

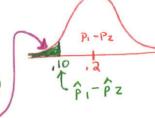

b) Find the probability of getting a difference in sample proportions

 $\hat{p}_1 - \hat{p}_2$ of 0.10 or less from the two surveys.

$$P(\hat{p}_1 - \hat{p}_2 \le 10) = P(Z \le \frac{10 - 120}{108}) = P(Z \le -1.72)$$

(3) Colculate Z score

c) Does the result in part (b) give us reason to doubt the counselors' reported value?

THE COUNSPLOR'S RESOLTS ARE SUSPICIOUS. THERE IS ONLY ABOUT A 4% CHANCE OF GETING

A DIFFERENCE IN SAMPLE PROPORTIONS FOR HW COMPLETION AS SMALL OR SMALLER THAN THE 10% REPORTED BY THE COUNSELURS.

■ Example 2 "You Try This One ©": Who Does More Homework #2?

Suppose that the counselors at School 1, Mike and Lynn, independently take a random sample 100 of students from there school and record the proportion of students that did their homework last night. When they were finished they find their difference in proportions was .08. They are surprised to get such a big difference, considering they were sampling from the same population.

Pm = MIKE %

a) Describethe shape, center, and spread of the sampling distribution of $\hat{p}_{_M} - \hat{p}_{_L}$.

BUTH COUNSELORS ARE FROM THE SAME SCHOOL.

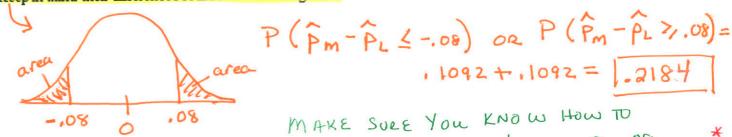

SCHOOL 1 (FROM EXAMPLE #1): P1=.3 1-P=.7 n=100

SPREAD PI=. 3 81=.7 N=100

$$\hat{P}_{m}-\hat{P}_{L}=\sqrt{\frac{.7(.3)}{100}+\frac{.7(.3)}{100}}=[.065]$$

b) Find the probability of getting a two proportions that are at least .08 apart

Keep in mind their differences could be lower or higher.

CALC: normal cdf (-E99, -.08, 0, .065) = .1092Of normal cdf (-E99, -1.23, 0, 1) = .1093c) Should the counselors have been so surprised to get a difference this big? * NOTE : ARE AREA MAY BE SLICHTLY DIFFERENT DUE TO ROUNDING

Since THE PROBABILITY IS NOT VERY SMALL (approx. ZZZO), WE SHOULD NOT BE SURPRISED TO GET A DIFFERENCE Page 16
BETWEEN THE 2 COUNSELORS HW PROPORTION OF O.08 OR LARGER BY CHANCE, EVEN WHEN THE SAMPLING IS FROM THE SAME POPULATION.

■ Confidence Intervals for $p_1 - p_2$ - Understanding the **Formulas**

When the Independent condition is met, the standard deviation of the statistic

$$\hat{p}_1 - \hat{p}_2$$
 is

SD WHEN WE KNOW P, and P2
$$\sigma \, \hat{p}_1 - \hat{p}_2 = \sqrt{\frac{p_1(1-p_1)}{n_1} + \frac{p_2(1-p_2)}{n_2}}$$
POPULA

statistic ± (critical value) · (standard deviation of statistic)

ON GREEN SHEET

Because we don't know the values of the parameters p_1 and p_2 , we replace them in the standard deviation formula with the sample proportions. The result is the

standard error of the statistic
$$(\hat{p}_1 - \hat{p}_2)$$
 $\sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$

$$\sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$$

SE (p, -p2)

FINDING THE CONFIDENCE INTERVAL:
3) If the Normal condition is met, we find the critical value z* for the 10
given confidence level from the standard Normal curve. Our
confidence interval for $p_1 - p_2$ is:
statistic ±(critical value) *\(\text{standard deviation of statistic} \)
Formula Name: 2 Sample CI for P $(\hat{p} - \hat{p}_2) \pm_{Z*} \sqrt{\frac{\hat{p}(1-\hat{p})}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$
Name: 2 Sample CI for P
4) Summarize the conditions to check for a confidence interval for $p_1 - p_2$:
Consitions
1) Random: EITHER EACH SAMPLE IS RANDOMLY SELECTED
OR TWO GROUPS ARE IN A RANDOMIZED
EXPERÎMENT
2 NORMAL: The distribution is approximately normal if the
Sample OR TREATMENT GROUP are at least 10.
N, P, 7,10 N2 P2 7,10

3 Independent:

· When sampling without replacement, Check the 10% condition for Bott samples.

n, q, 7, 10

· Both Samples or groups are independent as well as the individual observations within are independent.

Example #3: Teens & Adults on Social Networks -- Construct a Confidence Interval

As part of the Pew Internet and American Life Project, researchers conducted two surveys in late 2009. The first survey asked a random sample of 800 U.S. teens about their use of social media and the Internet. A second survey posed similar questions to a random sample of 2253 U.S. adults. In these two studies, 73% of teens and 47% of adults said that they use social-networking sites. Use these results to construct and interpret a 95% confidence interval for the difference between the proportion of all U.S. teens and adults who use social-networking sites.

Teens D=.73 n = 800

Adults 5=.47

n=2253

Define Parameters:

Pi= true proportion of u.S. Teens who use social network sites Pz=true proportion of U.S Adolts who use Social network

2) Check Conditions:

Random: 2 different rondom samples - random sample of teens (n=800) - random sample of adults (n=2,253)

I hdependent

- We clearly have 2 independent samples - teens and adults

- It is reasonable, there are 800(10) = 8,000 U.S. teens and 2,253(10) = 22,530 U.S. adults.

Normal We check the counts of "succeses" and "failures" for Both sample and found the normal conditions were met

Example 3 (continued)

3) Calculations:

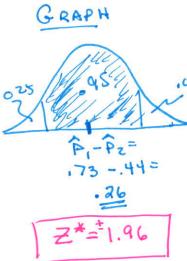

$$\hat{P}_1 = .73 \, (\text{TEENS})$$
 $N_1 = 800$
 $\hat{P}_2 = .47 \, (\text{ADULTS})$ $N_2 = 2253$

STATE " 2 Sample Z interval for a difference between 2 proportions"

4) Conclusion:

WE ARE 95% CONFIDENT THAT THE INTERVAL .223 TO .297 CAPTURES THE TRUE DIFFERENCE IN THE PROPORTION OF USTEENS AND US ADULTS WHO USE SOCIAL NETWORKING SITES.

** THIS INTERVAL SUGGEST THAT MORE TEENS THAN A DULTS IN THE U.S. ENGAGE IN SOCIAL NETWORK WG BY 22.3 TO 29.7 PERCENTAGE POINTS.

 $(\sqrt{n})^{2}(1.645)(\sqrt{.5})^{2}$
 \sqrt{n}
 \sqrt{n}

FNSURE ME IS MET Page | 11

CONCLUSION: We must have sample sizes of 3,383 from BOTH Texas and California.

APPENDIX:

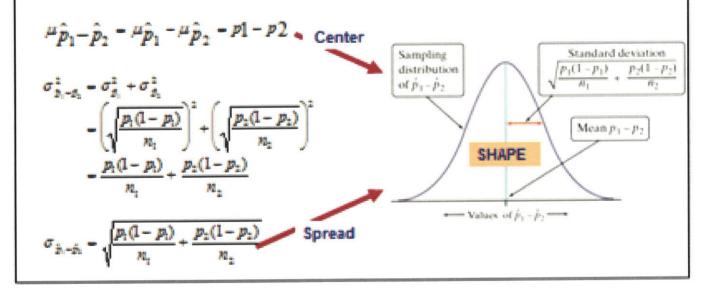

■ REVIEW Random Variables

Both \hat{p}_1 and \hat{p}_2 are random variables. The statistic $\hat{p}_1 - \hat{p}_2$ is the difference of these two random variables.

We learned that for any 2 independen transform variables X and Y,

$$\mu_{X-Y} = \mu_X - \mu_Y$$
 and $\sigma_{X-Y}^2 = \sigma_X^2 + \sigma_Y^2$

Therefore, Sampling Distribution of a Difference Between 2 Proportions:
