Science

A. Unifying Themes

A1. Systems

Students apply an understanding of systems to explain and analyze man-made and natural phenomena.

- a. Analyze a system using the principles of boundaries, subsystems, inputs, outputs, feedback, or the system's relation to other systems and design solutions to a system problem.
- b. Explain and provide examples that illustrate how it may not always be possible to predict the impact of changing some part of a man-made or natural system.

A3. Constancy and Change

Students identify and analyze examples of constancy and change that result from varying types and rates of change in physical, biological, and technological systems with and without counterbalances.

B. The Skills and Traits of Scientific Inquiry and Technological Design

B1. Skills and Traits of Scientific Inquiry

Students methodically plan, conduct, analyze data from, and communicate results of in-depth scientific investigations, including experiments guided by a testable hypothesis.

- a. Identify questions, concepts, and testable hypotheses that guide scientific investigations.
- b. Design and safely conduct methodical scientific investigations, including experiments with controls.
- c. Use statistics to summarize, describe, analyze, and interpret results.
- d. Formulate and revise scientific investigations and models using logic and evidence.
- e. Use a variety of tools and technologies to improve investigations and communications.
- f. Recognize and analyze alternative explanations and models using scientific criteria.
- g. Communicate and defend scientific ideas.

B2. Skills and Traits of Technological Design

Students use a systematic process, tools and techniques, and a variety of materials to design and produce a solution or product that meets new needs or improves existing designs.

- a. Identify new problems or a current design in need of improvement.
- b. Generate alternative design solutions.
- c. Select the design that best meets established criteria.
- d. Use models and simulations as prototypes in the design planning process.
- e. Implement the proposed design solution.

**Unit 1: The Skeletal System**

	<ul style="list-style-type: none"><li>f. Evaluate the solution to a design problem and the consequences of that solution.</li><li>g. Present the problem, design process, and solution to a design problem including models, diagrams, and demonstrations.</li></ul> <p>C. The Scientific and Technological Enterprise</p> <p>C1. Understandings of Inquiry</p> <p>Students describe key aspects of scientific investigations: that they are guided by scientific principles and knowledge, that they are performed to test ideas, and that they are communicated and defended publicly.</p> <ul style="list-style-type: none"><li>a. Describe how hypotheses and past and present knowledge guide and influence scientific investigations.</li><li>b. Describe how scientists defend their evidence and explanations using logical argument and verifiable results.</li></ul>

**Related  
Maine Learning  
Results**

- C2. Understandings About Science and Technology  
Students explain how the relationship between scientific inquiry and technological design influences the advancement of ideas, products, and systems.
- a. Provide an example that shows how science advances with the introduction of new technologies and how solving technological problems often impacts new scientific knowledge.
  - b. Provide examples of how creativity, imagination, and a good knowledge base are required to advance scientific ideas and technological design.
- C3. Science, Technology, and Society  
Students describe the role of science and technology in creating and solving contemporary issues and challenges.
- c. Explain how ethical, societal, political, economic, religious, and cultural factors influence the development and use of science and technology.
- C4. History and Nature of Science  
Students describe the human dimensions and traditions of science, the nature of scientific knowledge, and historical episodes in science that impacted science and society.
- a. Describe the ethical traditions in science including peer review, truthful reporting, and making results public.
  - b. Select and describe one of the major episodes in the history of science including how the scientific knowledge changed over time and any important effects on science and society.
  - c. Give examples that show how societal, cultural, and personal beliefs and ways of viewing the world can bias scientists.
  - d. Provide examples of criteria that distinguish scientific explanations from pseudoscientific ones.
- D. The Physical Setting
- D2. Earth  
Students describe and analyze the biological, physical, energy, and human influences that shape and alter Earth Systems.
- c. Describe and analyze the effects of biological and geophysical influences on the origin and changing nature of Earth Systems.
- D3. Matter and Energy  
Students describe the structure, behavior, and interactions of matter at the atomic level and the relationship between matter and energy.
- h. Describe radioactive decay and half-life.

Results**

E. The Living Environment

E1. Biodiversity

Students describe and analyze the evidence for relatedness among and within diverse populations of organisms and the importance of biodiversity.

- a. Explain how the variation in structure and behavior of a population of organisms may influence the likelihood that some members of the species will have adaptations that allow them to survive in a changing environment.
- b. Describe the role of DNA sequences in determining the degree of kinship among organisms and the identification of species.
- c. Analyze the relatedness among organisms using structural and molecular evidence.
- d. Analyze the effects of changes in biodiversity and predict possible consequences.

E2. Ecosystems

Students describe and analyze the interactions, cycles, and factors that affect short-term and long-term ecosystem stability and change.

- a. Explain why ecosystems can be reasonably stable over hundreds or thousands of years, even though populations may fluctuate.
- b. Describe dynamic equilibrium in ecosystems and factors that can, in the long run, lead to change in the normal pattern of cyclic fluctuations and apply that knowledge to actual situations.

E3. Cells

Students describe structure and function of cells at the intracellular and molecular level including differentiation to form systems, interactions between cells and their environment, and the impact of cellular processes and changes on individuals.

- a. Describe the similarities and differences in the basic functions of cell membranes and of the specialized parts within cells that allow them to transport materials, capture and release energy, build proteins, dispose of waste, communicate, and move.
- b. Describe the relationship among DNA, protein molecules, and amino acids in carrying out the work of cells and how this is similar among all organisms.
- c. Describe the interactions that lead to cell growth and division (mitosis) and allow new cells to carry the same information as the original cell (meiosis).
- d. Describe ways in which cells can malfunction and put an organism at risk.
- e. Describe the role of regulation and the processes that
